

Table of Contents

Introduction 4

Micro Selection 6

 8-bit vs 32-bit Micros 6

 Architecture 7

 Program Location 7

 C or Assembly Language 7

 Clock Frequency 8

 Internal vs External Peripherals 9

 GPIO 9

 Low Power Modes 10

Circuitry 11

 Logic families 11

 Single vs. Multi-gate Packages 11

 Enables 11

 LEDs 12

 The value of pull-ups 12

 Power managed devices 12

Power Supplies 13

 Lowest common voltage 13

 Split power rails 13

 Regulator simplicity versus efficiency 14

 Powering Down Circuits 14

 Batteries 15

Keep it cool 20

 Controlling Heat 20

 Driving loads 22

Firmware 25

Choice of programming languages..... 25

Main function vs the rest of the time 25

Frequency of events 26

Polled vs interrupt driven events 26

DMA vs firmware loops 26

UART FIFOs..... 26

Structured code..... 26

Value added and non-value added code 27

The power of loops..... 27

Know your variables 28

Timers 29

Compilers 29

Structures..... 30

Switch statements 31

Arrays and pointers 34

Floating point math and complex calculations 35

Library Functions 37

Design for power measurements..... 38

The Challenge Ahead..... 39

Summary..... 41
